Name _____ Period_____

1. The simulation below counts the number of coin flips it takes to achieve a specified number of heads in a row. Once the number of heads is achieved, the simulations stops and prints the number of coin clips. Consider the following output for different conditions.

Specified heads	Output
int numHeads = 4;	30 flips
int numHeads = 12;	10000 flips

Complete the CountHeads class below.

```
Public class CountHeads{

        public static void main(String args[]){

        }
}
```

2. Write the following for-loops as while loops

(a)
```
int y;

for(y = 5; y < 10; y+=2)
{

    System.out.println(y);

}
```

(b)
```
for(int z = 10; z > 0; z--){

    System.out.println(z);

}
```

/4

3. What is the output for each code segment below,

(a)
```
int m = 0;
int j = 0;

do{
j *= -1;
    if(j >= 0){
     m += 2;
    }
j+=2;

}while(m < 4);

System.out.println(j);
```

(b)
```
int i = 5, j = 0;
do{

    for(j = 0; j < i; j++){
        System.out.print("*");
    }
    System.out.println();
    i--;

}while(i > 0);
```

Score _____/20

4. The Magic 8 Ball is a plastic sphere resembling an 8-ball. Inside is a floating die with 20 faces. Each face has an affirmative, negative, or non-committal statement printed in raised letters. These messages are read through a window on the ball's bottom in response to a "yes" or "no" question. Finish the Magic8Ball class which simulates a Magic 8 Ball. <u>You simulator needs to produce messages for the first 2 cases only</u>. Once the message is displayed, prompt the user if they would like to play again. If the user types "y", the simulation will continue to run.

```java
Public class CountHeads{

        public static void main(String args[]){

        }
}
```
